The invention as claimed in the claims are directed towards a platform for supporting a reflector element and a carrier structure with a frame with hoop like end members between which the frame extends and support members which accommodate turning of the carrier structure about an axis of rotation which is coincident with a longitudinal axis of the reflector element

The documents above are prior art only and do not disclose all the features of claim 1, that is they do not disclose a platform for supporting a reflector element and a frame portion including hoop like end members. Therefore the claims are novel and have an inventive step.
